**PURPOSE:** To obtain a complex transparent and uniform material comprising three-dimensional fine network of metal oxide and an amide bonding-containing non reactive polymer uniformly dispersible in said network by reacting a hydrolysis-polymerizable metal compound in the presence of an amide bonding- containing non-reactive polymer and subjecting to gelation. **CONSTITUTION:** The objective transparent uniform material of organic-inorganic complex is composed of (A) a three-dimensional fine network structural material of metal oxide (preferably silica and/or alumina) and (B) an amide bonding-containing non-reactive polymer, e.g. polyoxazoline-based polymer or vinylpyrrolidone-based polymer, preferably having solubility in water, uniformly dispersible in the component A. Said material is preferably produced by dissolving the component B and a hydrolysis-polymerizable metal compound (tetraalkoxysilane, etc., is preferable in a case of silica as a generating metal oxide) in a solvent such as alcohol to obtain an uniform solution, dropping hydrochloric acid, etc., to resultant solution and subjecting to a hydrolysis- polymerization reaction and gelation with stirring.
